

Case Study:

Herning Hearing Clinic

An installation of 3 high performance acoustic doors plus windows

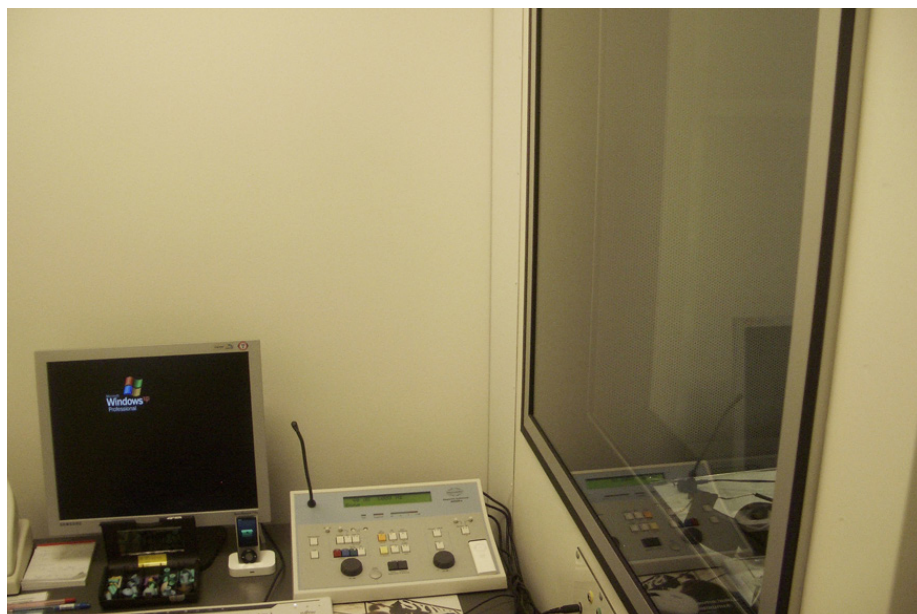

IAC provided a total treatment package of professional acoustic consultation & product solutions.

Herning Hearing Clinic is a private practice for ear, nose and throat (ENT) patients and offers specialist advice and treatment from professional ENT doctors. The clinic serves as a facility for doctors & practitioners dealing with ENT patients and associated illnesses, in addition to giving guidance on hearing aids.

Beforehand, the doctors at Herning Hearing Clinic shared a joint office. In order to perform comprehensive analyses and treatment within the clinic as a holistic solution, without the need for outsourcing, the doctors needed updated professional facilities.

IAC Acoustics was commissioned by Hørelinik Herning Aps to design two high performance turnkey treatment rooms.

IAC Acoustics delivered a professional facility for screening, diagnosis, monitoring and testing of prescription hearing aid devices.

The rooms were constructed from IAC's specialist Moduline demountable acoustic panel system with matching STC-51/Rw50dB acoustic doors & windows.

Further to this, a higher performance STC-61/Rw59dB acoustic door set was installed in an adjacent area.

The clinic also required a high performance acoustic door between operating & recovery rooms, specified as a large double door STC-51/Rw50dB for easy patient and stretcher access.
